Daniel Bonilla Arquitectos

PROFILE

tab >|

taller de arquitectura
de bogotá
daniel bonilla arquitectos

Architect with bachelor degree from Los Andes University (Bogotá, 1986), Master degree in Urban Design from Oxford Brookes University (Oxford, 1990) and further complimentary studies at the College of Technology in Dublin and Milan Polytechnic. After a thorough professional experience both in Bogota and London, in 1997 establishes in partnership with Marcela Albornoz an architecture and urban design studio “tab” (acronym for Bogota’s architectural workshop), where several projects from fields such as architecture, urban and industrial design, have been developed since.

A significant part of the projects has been commissioned as a result of awarded design competitions, obtained through public tenders, where the main aim has been concentrated on showcasing a universal vision of architecture, in conjunction with a strong sensitivity to the urban condition of each particular setting. In addition, the study of flexibility or mutation in architecture, and an extensive research on building envelopes, so called “skins”, has become a frequent characteristic and recurrent topic developed on his projects.

Daniel Bonilla actively participates as an academic, lecturing at several local and international universities. His work has been selected and awarded in biennials and international awards, and it has also been widely published in specialized media.

EDUCATION

Master of Urban Design	1989
Oxford Brookes University, England	1990
“City Design”, Summer School	
Polytechnic University of Milan, Italy	1990
Bachelor of Architecture	1981
Los Andes University. Bogotá, Colombia	1986
Semester abroad (Seventh semester of Bachelor of Architecture)	
College of Technology, Dublin, Ireland	1984

INVESTIGATION

tab, has worked in an extended variety of projects conceived under the scope of three different topics of research: the relationship among of void and mass, the flexibility or mutation, and the study of the building envelope or so called “skin”.

1. Research _ VOID AND MASS:

The building or the habitable space is considered as a result of the relationship among void and mass and “vice versa”; were both conditions are space and simultaneously defined by them as objects.

From a general perspective, the building or project can't exist successfully without enduring a good relationship with its setting, regardless of its urban or rural condition. Therefore, the project can and should contribute to his immediate environment, no matter its size, its use or even its function. This is the only way that allows the creation of a coherent relation with the territory, where the “mass” of the building and the “void” of the surroundings are able to actively interact.

It is crucial to identify the project's roll on its close environment, as well as the opportunities and responsibilities. In addition, it's essential to consider the threedimensional relationships, were variables such as “x” and “y” had to be considered in conjunction with the building's proposed connection at ground level. From this perspective, we understood the potential of buildings to create new topographies (levels), which could increase its direct interaction with urbanity and landscape.

2. Research _MUTATION:

The starting thought regarding these research topic, considered everyday flexibility in architecture as something possible mainly due to the furniture re-location. Nevertheless, we wondered if architecture itself can change?, if it's possible to transform a space with architecture and not whit furniture?, What if architecture can mutate without the need of tearing down walls, without a construction process?

In addition, we took into consideration mutability as a result of personal interpretations of space; for instance, Japanese residential architecture, is characterized by its spatial homogeneity, which acquires singularity in terms of function mainly through the use of small objects or a simple piece of furniture.

However, it's important to take into account, that there are additional strategies conceived and implemented by the architecture itself, which grant spatial changes, affecting size, form, spatial relations and even significance.

3. Research _ABSTRACT BUILDING ENVELOPE:

For centuries the interior – exterior relation provided in architecture was restricted to the definition of controlled openings onto walls; openings defined either as doors or windows. But then again, what happens if the relation of the solid element (wall) Vs. the opening (window) is similar?, is it then a wall or a window?. Furthermore, what happens if the ratio gets re-sized and we transform the wall onto a screen?, Is it then a screen considered a wall or a window... or both?

This simple thought, made us research and explore changing dynamics of projects through the manipulation of the “skin” – the envelope, which we understand associated to abstraction, texture, repetition, variation and sequence.

Without a doubt, the considerations comprehended by the research topics exposed before, structure formally and conceptually our projects; allowing us to implement and dose them in different ways, using different materials and geometries, and producing specific particular solutions to every project.
